CAREER OBJECTIVE

Computer Science student specializing in cybersecurity with hands-on experience in SOC automation, threat intelligence, and security monitoring. Proficient in building end-to-end security pipelines, threat visualization platforms, and privacy auditing systems using Python and modern frameworks. Passionate about defensive security, incident response, and continuously developing problem-solving skills.

EDUCATION

Galgotias University
Bachelor of Technology in Computer Science (CGPA: 7.8)

Gautam Buddha Nagar, India
Sept. 2023 – July 2027

TECHNICAL SKILLS

Languages: Python, Bash, Java (DSA)
Security Concepts: MITRE ATT&CK, Cyber Kill Chain, Threat Intelligence, Incident Response, Alert Triage, OSINT
Security & Monitoring: Wireshark, Nmap, Burp Suite, Splunk, Elastic Stack, Wazuh, Snort, IDS/IPS, Network Traffic Analysis
Frameworks & Tools: Flask, FastAPI, React, Streamlit, Neo4j, Presidio, REST APIs, SQLite, Firebase, Git, GitHub
Database: MySQL, SQL, DBMS Concepts
Operating Systems: Kali Linux, Ubuntu, Windows
Soft Skills: Analytical Thinking, Attention to Detail, Team Collaboration, Problem Solving, Adaptability, Time Management

PROJECTS

Aegis-SOC | L1/L2 SOC Automation Platform | *Python, Flask, SQLite, Wazuh, Suricata VirusTotal, AbuseIPDB* | [GitHub](#)

- Built a modular SOC triage platform ingesting real logs from 5 sources (auth.log, Apache/Nginx, Suricata, Wazuh) through a 14-stage automated pipeline.
- Implemented dual-source threat intel enrichment with dynamic severity reclassification across 4 levels, MITRE ATT&CK tagging, and kill-chain detection across 4 defined attack chains.
- Developed ML anomaly detection (Isolation Forest), lateral movement detection across 6 target systems, and 7-signal alert confidence scoring.
- Built a secured Flask dashboard with role-based access, false positive ticketing, 8 response playbooks, and 78 unit tests across 14 modules.

ThreatLens | Cyber Threat Graph Visualizer | *FastAPI, React, Neo4j, Gemini API, ReactFlow* | [GitHub](#)

- Built a full-stack threat visualization platform transforming raw security events into interactive graph-based attack investigations.
- Implemented attack path tracing, blast-radius simulation, and risk propagation analysis using graph traversal on Neo4j network relationships.
- Integrated Gemini API for AI-generated threat assessment to assist SOC analysts in investigation and hypothesis generation.
- Designed an APT simulation mapped with MITRE ATT&CK covering lateral movement, compromise progression, and multi-stage attack analysis.

Spectra | LLM Privacy Risk Evaluation Toolkit | *Python, Streamlit, Presidio, Sentence Transformers* | [GitHub](#)

- Built adversarial prompt pipelines to probe LLMs for PII generation risk, regurgitation, and membership inference signals across multiple Gemini models.
- Implemented weighted risk scoring using Microsoft Presidio, RapidFuzz, and Sentence Transformers with automated HTML reporting.
- Delivered real-time audit visibility via live Streamlit dashboard with structured per-module risk breakdowns.

ACHIEVEMENTS

Hack The Box Global Hackathon

- Led a team to 2nd place among Top 4 finalist teams representing Galgotias University in the HTB Global Cybersecurity Hackathon pre-qualifiers hosted by YNOV Campus, Paris.

Hackaccino 3.0 National Hackathon

- Built a data-driven women's safety platform for area-wise risk prediction; secured 17th place among 194 participating teams.

Problem Solving

- Solved 100+ problems across LeetCode and Codeforces practicing DSA

Head of Android Development Club at GTC

- Coordinated a joint ideathon with the Dev Circle Club, managing technical discussions and student participation across both clubs.
